       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB

SUBCELLULAR LOCATION: Membrane-bound. Endoplasmic reticulum.

TISSUE SPECIFICITY: LIVER. ALSO DETECTED IN SEVERAL OTHER TISSUES.

SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

probable 17K protein - vaccinia virus (strain Ankara)
C:Species: vaccinia virus
A:Variety: Strain Ankara
C:Date: 21-Jan-2000 #sequence_revision 21-Jan-2000 #text_change 18-Feb-2000
C:Accession: T37373
R:Antoine, G.; Scheiflinger, F.; Falkner, F.G.; Dorner, F.
submitted to the EMBL Data Library, March 1997
A:Description: The complete genomic sequence of the Modified Vaccinia Ankara (MVA) strain Reference number: Z20877
A:Accession: T37373
A:Status: preliminary; translated from GB/EMBL/DDBJ
A:Residues: 1-146 <ANTY
A:Cross-references: EMBL:U94848; PIDN:AAB96510.1
A:Experimental source: strain Ankara
C:Genetics:
A:Note: MVA097R
C:Superfamily: vaccinia virus H8 protein
                                                                                                                                                                                                                                                                                                                                         dynein heavy chain 3 - Chlamydomonas reinhardtii (fragment)
C;Species: Chlamydomonas reinhardtii
C;Species: O4-Feb-1998 #sequence_revision 13-Feb-1998 #text_change 21-Jul-2000
C;Accession: $72241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and may be an ECRTP/DEP-1 modulator, ECRTP/DEP-1 dimerisation promoter or antagonist and angiogenesis inhibitor. The purified antibody blocks endothelial migration and proliferation and inhibits angiogenesis in disorders such as inflammatory disorders including immune and non-immune inflammation, chronic articular rheumatism and psoriasis, disorders associated with inappropriate invasion of vessels such as diabetic retinopathy, neovascular glaucoma, capillary proliferation in atheresclerotic plaques, osteoporosis and cancer associated disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a novel purified antibody (or its fragment or derivative) which preferentially binds an endothelial cell receptor tyrosine phosphatase/density enhanced phosphatase-1 (ECRPP/DEP-1). The antibody has antiinflammatory, antipsoriatic, antirheumatic, antidiabetic, antiatherosclerotic, cytostatic and osteopathic activities antidiabetic, antiatherosclerotic, cytostatic and osteopathic activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         such as solid tumours, solid tumour metastases, angiofibromas, retrolental fibroplasia, hemangiomas, Kaposi's sarcoma and similar cancers. This sequence is peptide sequence #1 for epitope ECRTP/DEP-1 ectodomain binding antibody used to modulate angiogenesis, described: the method of the invention.

Note: This sequence for ECRTP/DEP-1 epitope, given in example 4, different that given in claim 3 (AAU08802).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; Page 82;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell:cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                27-SEP-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAY66771-958 represent peptides from the various Vbeta chains of T cell antigen receptor.

The human and murine sequences are given in (AAQ51543-45), peptide fragments able to generate antibodies are given in (AAR51951-61)

The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion. The classification of TT virus may lead to improved treatment of viral disease. The present sequence represents a fragment of TT virus protein used in the course of the invention.

                                                                               of maize are named zein) and 27-10 gamma-zein genes, so as to enhance gamma-zein production and lower alpha-zein production, so that methionine and lysine content of plant seed is increased over the content in native plant. PBF protein is a novel endosperm-specific cys2-cys2 zinc finger-type DNA binding protein of the DOF family. The transgenic monocot plant is a maize plant and expresses increased levels of methionine and/or lysine content in the seeds of the plant. The development of transgenic lines which supply higher levels of methionine reduces the need for methionine supplements for corn-soybean meal poultry feed and increased lysine content of either the cereal grains or the oilseed crops results in significant added nutritional value. The present is maize dof peptide domain ZMDOF2. This sequence contains a dof domain at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a transgenic monocot plant comprising an isolated DNA operably linked to a promoter, which is expressed to yield a prolamin box binding factor peptide (PBF). PBF then binds to promoter regions of 22-kD alpha-zein (prolamin seed storage proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel transgenic monocot plant, such as maize plant having increased methionine and/or lysine content in seeds, comprises recombinant prolamin box binding factor peptide gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize; alpha-zein; Prolamin box binding factor transgenic plant; promoter; endosperm-specific corn-soybean meal; cereal grain; oliseed crop;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE05149 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2001-441883/47

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to ERA binding domain polypeptides (AAG9955-AAG9989 and AAM00010-AAM0021). The era gene in Escherichia coli codes for an essential GTPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or posture the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and/or particle the protein and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and could be used as part of a vaccine and a vaccine and a vaccine a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (SMIK )

                                                                                                                                                                                                                   presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the

                                                                                                                                                                                                                                                          The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopolesis regulating activity, tissue growth factor activity, hammatopolesis regulating activity, tissue growth factor activity, hammatopolesis, activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzhelmer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, cancer diagnosis and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for serum type classification of TT virus (also known as hepatitis TT virus) has been identified. The method relies on the use of peptide fragments of the virus. The invention also relates to the use of TT virus peptides for anti-TT virus antibody determination. The anti-TT virus antibodies and the serum type classification method, can be used to screen TT virus, to determine its route of infection, and seroconversion. The classification of TT virus may lead to improved treatment of viral
                                                                                                 Peptides for determination of anti-TT virus antibody serum classification of TT virus using the peptides
